

MPD SKIMMER ALERT

A new type skimmer has been found across states, the new skimmer uses radio frequency so the thief does not have to retrieve the device they merely have to be close by and download the data and do not have to reopen the dispenser. In addition the new device has two feeds so they can capture magnetic stripe information as well as Pin's or zip codes from the keypads.

This skimmer connects via cables to the card reader and pin pad and the device is then stored further back in the dispenser. As the device is stored further back in the dispenser it may be more difficult to detect during inspections, however the additional cables should be a clue that a device is in the pump.

- Be familiar with the appearance of the inside of the dispensers.
- Upgrade Locks.
- Do at least daily inspections of all dispenser's.
- Utilize security to identify tampering.
- Etc.
